Project 1 Option B) Your Own App

Your task is to create AND be entered in to demo your own personal app idea. You may **not** share code

You are welcome to use any code from lecture or from your previous homework assignments, but start a new project from scratch with New | Project… in Xcode.

Required Tasks (doing this well will get you a "B"):

1. Implement a creative and unique app idea of your choice.
2. Present multiple views and flows utilizing what we have used in class. For each topic/page have a list, description, media, purpose.
3. For page topic, let the user read a short overview about that topic. Give the user the option of marking the record as read/complete.
4. Incorporate the following features into the app.
    a. Upon clicking on a card or record, a visual animation (Aka card flip, but can be anything creative pertaining to your app idea)
    b. Ability to navigate forward and back between records somewhere
    c. Ability to randomly shuffle and rearrange table or card data
    d. Ability to check record items and mark them complete like a checklist.
5. Make it easy for the user to see their progress through the flow of your app
6. Allow the user to mark any of the completed records or cards/views as not completed.
7. Progress should be persistent across launches of your app.
8. Your UI should work in portrait or landscape on any iOS device.
9. Provide a nice app icon so your app looks good on the iOS home screen.
10. Use Swift and SwiftUI best practices, following the principles I've been teaching and demonstrating. Be sure to address any errors and warnings before turning in your project. Target the latest iOS, version 27.
11. You agree to be entered into the "Swift Demo Day" and attend class that day. If you are not present and name drawn, you will receive a 10% deduction off your entire score for no showing.

To get an "A" on this project:

- Do something else that makes this app really nice. For example, you could administer quizzes on the various topics the user is studying, you could connect to your own api or database, you could apply visual sound and high quality content. You could integrate into apis and integrate AI chat, etc.
- Or something else that would give your app that "it" factor? You should do something impressive, not something really easy.

Hints

I will definitely help you out with hints on how to accomplish various tasks for Project 1. Let me know what questions you have as you work on this project.

It helps to sketch a storyboard of your app. Sketch out the different scenes and how the user will navigate from one to the next.

It also helps to design the data structures you'll need early in the app development process. You can use a class diagram or an ER diagram or something else entirely — whatever is understandable for you.

Extras

You may get extra credit for Option B if you present in demo AND are ranked in the top 3 votes for the class on Swift Games day. This will be applied outside of this assignment itself. In regards to this rubric, you can not get more than 100% for this project. But if you do some excellent extra features beyond just what is required, that could make up for some points lost in the required tasks. I encourage you to go above and beyond just what is required. If you've ever used an app like DuoLingo, you'll be aware of lots of ideas of how your app could be more sophisticated. However, don't get carried away.
